TVS-53

THE VEGETABLE SITUATION

Summary

Market supplies of truck crops available in May and in prospect for the early summer continue smaller than a year earlier, but supplies of new potatoes are larger. Unfavorable weather -- too much rain in some areas and too little in others -- has reduced the yield prospect for a large number of items. As a result market prices of truck crops have shown less than the usual seasonal decline in recent weeks, and were at relatively high levels during late May. Prices of new potatoes have declined seasonally in May and in the latter part of the month averaged only slightly below prices a year earlier.

The supply of new potatoes is rapidly increasing as the important second section of early States comes into full production. Carlot shipments are increasing and probably will reach a seasonal peak in June. The crop in this area is about 3 million bushels larger than in 1940. For the second early group, which markets largely in June, a smaller crop than that of last year is indicated, but the prospect is for a slightly decreased output in the first section of intermediate States. Old stock potatoes are continuing relatively plentiful but marketings will be completed soon.

Supplies of truck crops are increasing in volume as more northern areas come into production, but the seasonal increase this year is not as great as usual. There are prospects of larger supplies than a year earlier of some items, but these are more than offset by prospects of smaller supplies of others. The total tonnage available for market and in immediate prospect is about 1 percent below the comparable output last season.

Increased acreages of processing truck crops are being planted this season in response to the improved demand prospects and the Government's food-for defense program.

-- May 29, 1941

POTATOES.

BACKGROUND. - The relatively low prices received by growers for the large 1940 late crop have resulted in a decrease of 5.5 percent in the prospective acreage for 1941. The acreage planted or to be planted in the early States is increased 3.6 percent but in the intermediate States it is decreased 1 percent. For the country as a whole the prospective acreage of all potatoes is reduced 4 percent to 2,988,000 acres, the smallest acreage since 1926. Such an acreage with yields equal to the average of the last 4 years would result in a United States potato crop of 367 million bushels, or about 8 percent less than the large crop of 1940.

Fall and winter production totaled 1.5 million bushels, or about 300,000 bushels more than in the previous season, but commercial production in the first section of early States (north Florida and the Lower Valley of Texas) totaled 2.4 million bushels this season compared with 3.7 million a year earlier. Although the acreage was increased slightly this season, yields are indicated to be lower than in 1940.

Recent developments

Supplies of new potatoes available for market during the next 2 months are expected to be slightly larger than those of the corresponding period a year earlier. They are expected to originate in the second section of early, the second early, and the first section of intermediate States. Production of potatoes in the second section of early States, (Ala., Calif., Ca., La., Miss., S.C., and other Texas) totals 20.9 million bushels this season compared with 18 million bushels in 1940. The larger crop resulted from both increased plantings and generally higher yields per acre. Shipments from 3 of these States, Alabama, Louisiana, and California are well under way, and shipments are beginning in the others. The total movement has been increasing rapidly during recent weeks and is expected to reach a peak sometime in June.

In the second early group (Ark., N.C., Okla., and Tenn.) the commercial potato crop is indicated to total 5.1 million bushels this season or about 1.1 million short of the production last year. Shipments from this area are expected to get started in June. In the first section of intermediate States (Kan., Ky., Md., Mo., and Va.) the acreage planted to the commercial potato crop is increased slightly this season over last, and the condition of the crop is generally good except in Virginia and Maryland, where more moisture is needed. It is probable that the total output of this area will be slightly smaller than the 10.9 million bushels produced last season.

TVS-53 - 5 -

It is indicated, however, that the supply of new potatoes available for June and July marketings will be about 1.5 million bushels larger than in the corresponding period in 1940. The effect of this larger supply together with larger quantities of old stock remaining probably will be offset to a large extent by a higher level of consumer purchasing power this season.

TRUCK CROPS

BACKGROUND. - Continuing the long-time upward trend that has been in evidence for some years, the acreage planted to fall and winter truck crops this season increased 9 percent over that of the previous season and totaled 89,940 acres. Unfavorable growing weather resulted in reduced yields for some of the more important items, and, as a consequence, the total tonnage produced was smaller than in the 1939-40 fall and winter season. This was particularly true of fall carrots, celery, eggplant, peppers, shallots, and tomatoes.

Unfavorable growing weather during most of the spring months of 1940 resulted in generally short production of a number of truck crops, which in turn resulted in unusually high prices. In response to these high prices, producers of late winter and early spring vegetables increased the acreage of truck crops in 1941 to 193,100 acres, 5 percent over the relatively small acreage harvested in 1940. Although plantings were increased, continuous heavy rainfall during the first quarter of 1941 in the deep South and in California caused some losses of truck crop acreages and severely reduced the yield per acre. Production for the late winter and early spring market, therefore, was about 12 percent below that of a year earlier. Some of the early crops below last year in production were cabbage, celery, lettuce, shallots, and tomatoes. This smaller output, together with improved purchasing power of consumers, resulted in a relatively high level of market prices during the first quarter of 1941. During April the weather continued unfavorable in many areas and truck crop production failed to make the usual seasonal increase. Prices remained at generally high levels. The acreage of truck crops harvested from the beginning of the present season to late May totaled 502,000 acres, or about 3 percent more than was harvested to the same time last season. Lower than average yields, however, resulted in a total tonnage 9 percent below that of 1940.

Recent developments

The acreage planted or to be planted this season to truck crops for market, as reported to May 15, totals 1,415,000 acres compared with 1,405,000 acres planted or to be planted (as reported to a comparable date) last season, and 1,362,000 acres the 10-year (1930-39) average. Production estimates available for only 852,000 acres, compared with 848,000 acres a year earlier, total 2,558,000 tons. This tonnage is about 163,000 tons short of the output for the comparable period in 1940. Because of the unfavorable growing conditions during most of the current season, yields averaged about 7 percent smaller.

Supplies of truck crops now being harvested and available for harvest during the next month or two are indicated to be about 1 percent smaller than those of a year earlier and about 3 percent smaller than the recent 10-year

average supplies. The acreage is indicated to be decreased 3 percent but yields are up a little over 2 percent. As compared with supplies last season, a smaller output of cantaloupes, carrots, cauliflower, eggplant, green peas, green peppers, spinach, tomatoes, and watermelons more than offsets a slightly larger production of asparagus, lima beans, snap beans, cabbage, celery, cucumbers, lettuce, and onions.

Partly because of this continued smaller output, market prices in general have been relatively high this season and are expected to continue higher than a year earlier for some time to come. A higher level of consumer purchasing power this season compared with that of recent years has also been a contributing factor.

Round-up of crops

Asparagus: The late crop, including production both for fresh market and for processing, is indicated to total 5.3 million crates this season compared with 4.6 million produced last season. Cool weather and in some instances frost have retarded growth of the late crop in the northeastern States. The harvest is now in full swing. A considerable portion of this crop is used for canning and for quick freezing. Since the pack of canned asparagus in California has been cut short this season by labor difficulties, a larger than usual quantity probably will be canned in the late States. This may strengthen the demand for the later cuttings materially.

Lima beans: A good crop is expected to be available for market in North Florida in early June. Also a crop of 234,000 bushels is indicated for the second early States of Georgia and South Carolina this season compared with 198,000 bushels last season. Shipments from these areas are expected to start moving about June 1, and become heavy by June 15. In North Carolina where shipments usually begin about June 20, the acreage planted to lima beans this season is slightly larger than that of last season, so it is anticipated that market supplies during June and July will be rather plentiful. Also in the second section of intermediate States (Maryland, New Jersey, and Virginia) the prospect is for increased plantings, since prices last season were well above those of the previous year.

Snap beans: Supplies of snap beans now being marketed from the second early States (Alabama, Georgia, Louisiana, Mississippi, and South Carolina) and those expected to be marketed from the first section of intermediate States (Arkansas, North Carolina, Tennessee, and Virginia) during June are indicated to be well above production in these areas last season. Production in the 2 groups of States totals 3.6 million bushels this season compared with 2.6 million bushels in 1940. In the second section of intermediate States (Delaware, Illinois, Maryland, and New Jersey) most of the crop is planted, but coel dry weather has retarded growth. It is expected that the acreage may be increased slightly over that of the previous season. The third section of intermediate States (Georgia, North Carolina, and South West Virginia) probably will have slightly smaller plantings this season than in 1940 because prices were fairly low last year.

TVS-53 - 7 -

Cabbage: Production in the second early States (Alabama, South Georgia, Louisiana, Mississippi, North Carolina, South Carolina, and Virginia) where the harvest is nearing completion, totals 117,200 tons or slightly less than was expected earlier but about 13,200 tons more than in 1940. Although no estimate of the intermediate crop is yet available, the acreage this season is slightly smaller than in 1940, and the crop in some areas is suffering from dry weather. The tonnage produced in this group of States probably will be somewhat smaller than the 233,200 tons produced last season. In some of the late States the cabbage crop is making good progress.

Cantaloups: A relatively small crop of cantaloups and similar melons, 1.9 million crates, is indicated for this season in the early States, California (Imperial Valley), and Florida. This small crop is the result of both a reduced acreage and lower-than-average yield prospect. Shipments from the earliest planted areas are now moving to market at fairly high prices. A sharply increased acreage has been planted this season in the second early States, however, and, if average yields are obtained the increase in production in this area will more than offset the decrease in the early areas. Marketings from this second early group usually begin in June. The prospect, therefore, is for plentiful supplies during the summer months. In the intermediate States plantings are making progress, but cool dry weather in the eastern States has retarded growth. Some replanting has been necessary in Washington and Oregon.

Cucumbers: Because of unfavorable weather this season to date market supplies of cucumbers have been short and prices relatively high. The prospective crop in the first section of early States (Florida and Texas) was reduced further by recent heavy rains in Texas. The early crop is now indicated to total only 675,000 bushels compared with 1,130,000 a year earlier. In the second section of early States (Alabama, California, Georgia, Louisiana, and South Carolina) the crop, totaling 1,395,000 bushels, is slightly larger than that of 1940 and is about ready for market. Because of the relatively low prices received last season, the acreage planted this season in the second early States (Arkansas, North Carolina, and Virginia) is indicated to be about 7 percent smaller than the acreage planted last season. This reduction in plantings in the second early States may be offset, however, by a slight increase in the intermediate States (Delaware, Illinois, Maryland, and New Jersey). The prospect is for only moderate supplies for the next 2 months.

Lettuce: Supplies of lettuce coming from the intermediate States (Idaho, New Jersey, Oregon, Virginia, and Washington) during the next few months are expected to be slightly larger than those of a year earlier. Transplanting in the first section of late States (California, Colorado, New Mexico, New York, and Pennsylvania) is making rapid progress and the crop is in good condition. Also there will be considerable quantities of lettuce available in the market garden areas during June and July.

Onions: Prospects for the early onion crop were reduced materially by heavy rains in Texas, and the crop now is indicated to total only 1.6 million 100-pound sacks. This compares with the earlier forecast of 2.1 million sacks and with the small crop of 1.3 million produced last season. Because of unfavorable weather the harvest got a late start but volume shipments are now moving at relatively high prices. The crop in the first section

of intermediate States (North Texas and California) is expected to be considerably larger than that of last year, however, and will be available for market during June. The acreage in this area is increased 15 percent over that in 1940. Also the acreage in the second section of intermediate States is indicated to be increased 27 percent. Marketings from this area will be available in July. The prospect, therefore, is that supplies of onions will be substantially larger this summer than last.

Green peas: Production of green peas in the 2 groups of intermediate States (North Carolina, Virginia, Idaho, Maryland, and New Jorsey) this season is substantially smaller than in 1940. This smaller output is largely the result of reduced plantings but dry weather in the eastern States also has reduced prospects semewhat. In the first section of late States (Colorado, New York, Oregon, and Washington) green peas are in good condition and a larger output than that of last year is expected to be available this season. Volume shipments from this area probably will be moving in late June and early July.

Green Peppers: A relatively small spring crop of green peppers is in prospect in Florida this season. The acreage remaining for harvest is about the same as that of a year earlier but yields are expected to be much smaller. In the second early States (Georgia, Louisiana, Mississippi, and South Carolina) the harvest is expected to begin about June 1, and the prospect is that supplies will be little different from those of last season.

Tomatoes: Supplies continue smaller than those of a year earlier, and the immediate prospect is for smaller crops in the second early and intermediate States. Production in the second section of early States was reduced by heavy rains in Texas to 2.4 million bushels from the 2.6 million indicated earlier in the season. The smaller crop this season in the second early States (Georgia, Louisiana, Mississippi, South Carolina, and other Texas) is largely the result of a smaller acreage remaining for harvest. The crop is late this season but picking is expected to start in early June. In the intermediate States a smaller acreage is planted this season as compared with last, and the plants in some localities are suffering from dry weather.

Watermelons: The acreage planted or indicated to be planted to watermelons this season in commercial areas totals 275,280 acres compared with 277,300 acres planted last season. A decrease in the second early group of States more than offset slight increases in the early and late States. Because of low yields in prospect, however, the early crop is slightly smaller than that of last season. Shipments from this area have started, but the crop in some of the second early States is late. In general it now appears that supplies of watermelons for the early summer months will be somewhat smaller than those of last season.

TRUCK CROPS FOR PROCESSING

The acreage planted or to be planted to 10 important truck crops for processing is indicated to total 1,533,000 acres this season, or about 13 percent more than was planted to these crops last season. Increases are quite general, ranging from 2.6 percent (early reports) for tomatoes to 27 percent

TVS-53 - 9 -

for beets. Since these reports were compiled, the Department of Agriculture launched a food-for-defense program which, among other things, provided for a 50-percent increase in the canned tomato pack this season over that of last year. Also the Agricultural Adjustment Administration has authorized the removal of some of the important truck crops for processing from the acreage allotments, so that growers could be free to contract for increased acreages. These two developments have undoubtedly resulted in larger plantings to some crops than the early intention reports indicate. The increase in the acreage of green peas for processing, for instance, is now indicated to be 13 percent compared with 8 percent previously reported in prospect. Also there are indications that the increase in sweet-corn and tomatoes will be definitely larger than was anticipated earlier.

Green lima beans: According to recent reports the acreage to be planted to lima beans for processing this season is indicated to be 19 percent larger than the acreage planted last year. If these early prospects materialize the planted acreage will total 61,900 acres and will exceed by 13 percent the previous record-large acreage of 55,010 acres planted in 1938. Assuming average abandonment of about 4.4 percent and average yields of 1120 pounds per acre, the prospective acreage would result in a production of 33,100 tons for caming and freezing. This tonnage compares with 26,930 tons produced in 1940 and the 10-year (1930-39) average of 18,180 tons. Stocks of canned green lima beans totaled 565,000 cases on April 1, or about 33 percent less than a year earlier, an indication that the carry-over as of July 1 will be considerably smaller than in 1940. Also stocks of frozen green limas as of May 1 were 23 percent smaller than on May 1, 1940. These smaller stocks, together with improving demand, indicate the need for the larger crop this season.

Green peas: The acreage planted to green peas for processing this season is indicated to total 384,000 acres, or about 13 percent more than the 1940 plantings of 340,000 acres. An increase of 17 percent is indicated for the important Middlewestern States but an increase of only 9 percent is indicated for the Tri-State area, and 8 percent for the Western and Northeastern groups. For the country as a whole about 62 percent, or 239,000 acres, consists of sweet wrinkled varieties and 38 percent, or 145,000 acres is planted to the smooth round varieties. These acreages represent increases of 14 and 12 percent respectively over the areas planted in 1940. A little over 35,000 acres of the total for the United States is indicated to be for freezing this season, or about the same acreage as in 1940.

Stocks of canned green peas on May 1, 1941 totaled 3,003,000 cases compared with 3,627,000 a year earlier, but stocks of frozen peas totaled 17,303,000 pounds against 12,304,000 on May 1, 1940.

Potatoes: Acreage, yield per acre and production, average 1930-39, annual 1939, indicated 1941

Compiled as follows: September 1939-February 1940 from Federal State Market News Service, "Bulletin No. 315"; beginning March 1940 from Bean Market Review, weekly, San Francisco.

^{1/} These prices are not strictly comparable with those published previous to January 1941 inasmuch as the previous series included 10 cents for brokerage which has now been deducted.

^{2/} Excludes seed stock.
